CS 210   Spring 2012
Module 8
Backup and Restore

In this module you will implement backup and restore using Java serialization. This will be used to backup the entire database and restore it on command.

HINT. First, read up on serialization. For each active table in the database, read all data from the binary file and store it in a dataset as a field in the table. Serialize the table collection. On restore, read the object back in, and for each table, rewrite its binary file.
